Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein search,

FUNCTION: SECOND TRIFUNCTIONAL ENZYME ACTING ON THE BETA-OXI PATHWAY FOR FATTY ACIDS, POSSESSING HYDRATASE-DEHYDROGENASE-EPIMERASE ACTIVITIES. CONVERTS TRANS-2-ENOYL-COA VIA D-3-HYDROXYACYL-COA TO 3-KETOACYL-COA.
                                PATHWAY: BETA-OXIDATION PATHWAY. SUBUNIT: MONOMER (BY SIMILARITY). SUBCELLULAR LOCATION: CATALASE-FREE DOMAIN: CONTAINS TWO SDR DOMAINS.
                       SIMILARITY: BELONGS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TKRLDLMMNVNTRGTYLASKACIPYLKKSKVAHILNISPPLNLNPVWFKQHCAYTIAKYG

Non-structural protein 1 interactor 1 (NSII-1) (W16329) is a human host cell protein which interacts with influenza virus protein NSI. It was identified using a yeast interactive trap system. Its amino acid sequence was deduced from NDII-1 cDNA (T63340). Another

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                olated from Bacillus sp. IKD-5A868 strain. The protein can be expressed standard recombinant methodologies. D-arabinitol dehydrogenase is used a clinical diagnosing agent for mycosis. The present sequence presents the D-arabinitol dehydrogenase enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 host cell protein, NPI-1 (W63327), has also been identified. These host cell proteins can be used in assays to identify cpds. that interfere with the specific interaction between the viral and host cell proteins. Such cpds. can be used to treat viral infection.

The enzyme is derived from the mycelium of a Streptomyces species, especially S. clavuligerus (e.g. ATCC 27064), S. jumojensis (e.g. ATCC 2864) or S. katsurahamanus (e.g. T272). The present sequence represents the enzyme from S. clavulary ATCC 27064.

The enzyme is used to catalyse the biosynthesis of clavulanic acid from a precursor clavulanic acid aldehyde. The obtained clavulanic acid is in turn a key ingredient in the antibiotic Augmentin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   acid ester. The specification describes a method for producing a (S)-4-halo-3-hydroxybutyric acid ester. The method comprises asymmetrically reducing 4-halo-acetoacetic acid ester or its derivative with beta-ketoacyl-acyl carrier protein reductase constituting Type II fatty acid synthase, or acetoacetyl-CoA reductase constituting the polybeta-hydroxy fatty acid biosynthesis system. The novel method is used to produce optically active 4-haol-3-hydroxybutyric acid ester, with a high purity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a beta-ketoacyl-ACP reductase protein of Bacillus subtilis. The beta-ketoacyl-ACP reductase enzyme constitut a Type II fatty acid synthetase. The enzyme has an extremely high reducing activity and steroselectivity towards 4-chloroacetoacteic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Beta-ketoacyl-ACP reductase; Type II fatty acid synthetase; steroselectLvity; 4-chloroacetoactteic acid ester; (S)-4-halo-3-hydroxybutyric acid ester; 4-halo-acetoacetic acid ester; beta-ketoacyl-acyl carrier protein reductase; acetoacetyl-CoA reductase; polybeta-hydroxy fatty acid biosynthesis; optically active;

The reductase has excellent stereoselectivity producing optically active (S)-4-halo-3-hydroxybutyrate ester with high optical purity and in high yield. (S)-4-halo-3-hydroxybutyrate ester is a useful drug intermediate and is also of importance in alcohol production. The present sequence is the glucose dehydrogenase protein of Bacillus subtilis. Glucose dehydrogenase is important in the regeneration of NADPH. The glucose dehydrogenase gene (A38806) was inserted into a plasmid, already carrying the carbonyl reductase gene of Kuuyveromyces aesturii resulting in coexpression of the two genes from the same
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Carbonyl reductase reduces 4-haloacetoacetate ester to produce (S)-4-halo-3-hydroxybutyrate ester, using reduced beta-nicotinamide adenine dinucleotide (NADH) as an electron donor. This enzyme is useful because it has a high reductase activity for 4-chloroacetoacetate ester but does not substantially dehydrogenate any optical isomers of 4-halo-3-hydroxybutyrate ester. In comparison with other enzymes with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Carbonyl reductase; (S)-4-halo-3-hydroxybutyrate ester; drug synthesis; reduced nicotinamide adenine dinucleotide; NADH; alcohol production; 4-haloacetoacetate ester; glucose dehydrogenase; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plasmid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kimoto

                                                                                                                                                                                                                                                                                         The present sequence represents the glucose dehydrogenase protein of Bacillus subtilis. The glucose dehydrogenase gene was cloned, in the course of the invention, to regenerate the reduced nicotinamide adenine dinucleotide phosphate. The specification describes a method for producing a (S)-4-halo-3-hydroxybutyric acid ester. The method comprises asymmetrically reducing 4-halo-acetoacetic acid ester or its derivative with beta-ketoacyl-acyl carrier protein reductase constituting Type II fatty acid synthase, or acetoacetyl-CoA reductase constituting the polybeta-hydroxy fatty acid biosynthesis system. The novel method is used to produce optically active 4-haol-3-hydroxybutyric acid ester, with a high purity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             08-MAY-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a multifunctional enzyme designated Fox2. Such multifunctional enzymes may be used in the method of the invention. The specification describes a method for manipulating the metabolism of a plant, and comprises expressing a heterologous gene encoding fatty acid oxidation enzymes in the cytosol or plastids other than the peroxisomes, glyoxisomes or mitochondria of the plant. The method may be used to enhance the biological production of polyhydroxyalkanoates or novel oil compositions in a transgenic plant. Plants which may be used to produce these compounds in this way include Brassicas, maize, soybean,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cottonseed, sunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco and alfalfa. The method may also be used to prevent or suppress seed production and therefore increase the production of biomass (leaves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   W09945122-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                 The sequence corresponds to a rape leaf beta-ketoreductase encoded by a cDNA insert in plasmid pJRL6.2 in Escherichia coli XL1-Blue. A plastid stroma targeting transit peptide is present. DNA encoding the protein may be inserted in a vector or expression cassette in sense or antisense orientation for expression in an oilseed plant, e.g. for production of transgenic rape plants with low or modified oil content, diversion of metabolism to alternative
storage compounds, e.g. starch, protein or engineered polymers, or production of plants with enhanced oil content. The DNA may also be used as a probe to obtain similar genes from other plants. The transit peptide may be used to direct other proteins to leaf

A plastid stroma targeting transit peptide is present. DNA encoding the protein may be inserted in a vector or expression cassette in sense or antisense orientation for expression in an oilseed plant, e.g. for production of transgenic rape plants with low or modified oil content, diversion of metabolism to alternative storage compounds, e.g. starch, protein or engineered polymers, or production of plants with enhanced oil content. The DNA may also be used as a probe to obtain similar genes from other plants. The transit peptide may be used to direct other proteins to seed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antidiabetic; hypotensive; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, vital, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  used to produce the HSCD enzyme, according to standard recombinant DNA methodology. The enzyme may then be used as an antigen in the production of antibodies or in assays to identify antagonists of HSCD activity. These antagonists may then be used to treat disorders associated with inappropriate expression, or over activity of HSCD such as immune disorders and cancers (the antagonist interferes with the reaction between pyruvate and conczyme A). For example, the antagonists may be used to treat leukemia, lymphomas, adenocarcinomas and cancers of the breast, lung, testis, prostate and brain, Addison's disease, acquired the contraction of the contractio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           dehydrogenase enzymes catalyse an irreversible reaction between pyruva and coenzyme A, to form CO2 and the intermediate COA, in mitochondria. Host cells containing vectors comprising the HSCD nucleic acid may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding human short chain dehydrogenase enzymes useful for the diagnosis, prevention and treatment of disorders associated with abnormal expression of the enzyme, such as immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mitochondria; immunė disorder; cancer; leukemia; adenocarcinoma; lymphoma; breast; lung; testis; prostate; brain; Addison's disease; acquired immune deficiency syndrome; asthma; anemia; Crohn's disease; Graves disease; AIDS; gene therapy.

          coll cells, and transcounced The mutant GDH is not influenced fetramer and is thermostable.
                                      The glucose dehygrogenase enzyme is encoded by a recombinant DNA colone from Bacillus megaterium. The DNA sequence may be mutated by site directed mutagenesis to introduce mutations to the protein sequence (see feature table). The DNA may be used to transform E. coli cells, and transformants may be cultured to mass produce GDH.
                                                                                                      Claim 1; Page 8;
                                                                                                                                   Glucose dehydrogenase prepn. using transformed recombinant from Bacillus megaterium - has specified transformations giglucose dehydrogenase-expressing vector, introduced into E.

                                                                                                                                                                                                                                                                                                                                                                                                                                The normal Glu-96 residue is replaced by Lys, Gly or Ala,Gln-252 by Leu or Tyr-253 by Cys. Ser-22 residue can also be Ala, Asp-43 can be Glu, Ala-79 can be Ser and Leu-95 can be Met.E. coli containing this sequence will produce a form of GDH with improved heat stability. the enzymes are useful for glucose assay and can be produced at low costs see also Q03772.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glucose dehydrogenase; Bacillus megaterium; glucose assay; ss.

                                                                                                                                                                                                                                                                                          This sequence represents the claDH protein which is a putative clavulanate-9-aldehyde reductase used in the biosynthetic pathway for clavulanic acid in Streptomyces clavuligerus. The invention relates to methods of improving production of clavulanic acid by Streptomyces by super-expression of claR gene. The claR gene is characterised in that it is localised in the gene group encoding genes for biosynthesis of clavulanic acid.

   Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from a pool of 5,000 clones made from the same library (cloneaDs 1322376-1323911, 1456007-1456775, and 150052-1502855). Subtraction by Bento Soares and M. Fatima Bonaldo. "

   This is the DNA sequence of vector ptrAP3. This mammalian expression vector contains a cDNA encoding human placental alkaline phosphatase (AP, see w55047) lacking a signal sequence. When the prosphatase (AP, see w55047) lacking a signal sequence. When the prosphatase (AP, see w55047) lacking a signal sequence. When the prosphatase (AP, see w55047) lacking a signal cell line, such as COS7 cells, AP protein is neither expressed nor secreted since the AP cells, AP protein is neither expressed nor secreted since the AP cells, AP protein is neither expressed nor secreted since the AP cells, and expression and secretion of properties a signal peptide or a membrane cells. Cells the sequence into ptrAP3 facilitates the expression and cells. Cells therefore indicates the presence of a signal sequence in the presence of AP activity in the supernatants of transfected cells therefore indicates the presence of a signal sequence in the cells represented of the presence of a signal sequence in the presence, i.e. secreted or membrane-associated proteins of the cells of the protein sequence, i.e. secreted or membrane-associated protein sequence in the cells grated ethb0018f2, was isolated clone (see v27707), cells therefore indicated using the novel method and cell cenodes a human neural adhesion protein (see w55045) protein having militable for high throughput screening techniques and cells in the mattine.

                     This DNA sequence comprises the HindIII/XhoI fragment of the CC SR alpha enhancer/promoter in plasmid pcDL-SR alpha 296. The CC SR alpha enhancer/promoter is composed of human T cell leukaemia CC virus 1 5' untranslated sequences and the SV40 enhancer. It is CC 10-fold in host cells, and is active in a broad range of cell CC types. The SR alpha enhancer/promoter has been utilised in CC expression vectors designed for efficient expression of genes in CC entraptic cells. The invention provides vectors and improved CC methods for the expression and co-amplification of genes encoding CC recombinant proteins in cultured cells. The methods permit the CC isolation of cell lines which have co-amplified input recombinant sequences which encode an amplifiable marker, one or more cappression vectors encoding a protein of interest and optionally a Selectable marker. The amplified cells provide large quantities of recombinant proteins suitable for immunotherapy for treatment of C custom vaccines, including multivalent vaccines that reflect the coveres of somatic variation found in a patient's tumour.
   밁
  Multivalent vaccine to treat B cell lymphoma or leukaemia comprises at least 2 different recombinant variable region

  The present sequence is used in the plasmid vectors of the invention. The vectors which comprise a gene which can induce apoptosis under specific conditions, e.g. guanine phosphoribosyltransferase (gpt), or a reporter gene, e.g. luciferase, where the gene is situated downstream of a promoter which responds to specific extracellular stimulation such as the presence of a cytokine, e.g. tumour necrosis factor (TNP) or interleukin-1. The vector may be used to transform a suitable cell line, such as a cell line which does not produce hypoxanthine-guanine phosphoribosyl transferase (HGPRT). The transformed cells are used to test the inhibitory effect of a gene or interacting the state of the
   reporter gene and promoter sequence, potential anti-inflammatory agents

  This sequence represents a DNA molecule with gene expression regulation activity. This sequence is used in a plasmid for regulation of gene expression, and treatment of viral infection pref. human T-cell leukaemia and HIV. The plasmid also encodes a protein which is used as an antivirus agent, and also in a method for detecting cancer. The DNA molecule and protein have potential uses in gene therapy, and the plasmid may also have potential use in the treatment of TSP.

   To confer retroviral resistance on a cell, the cell is transformed with a vector comprising a polynucleotide coding for RNA which is complementary or homologous to a nucleic acid sequence within at least one gene from the retroviral genome and which inhibits replication of the retrovirus. Particularly preferred target genes are those coding for the ENV, POL, GAG proteins. Antisense sequences may also target the ART and TAT splice sites, the region around the translation initiation codon (AUG) or the primer binding site (PBS) of the retrovirus. The method is especially intended to confer resistance to infection by human immunodeficiency virus (HIV), feline leukeemia virus (FELV) or human T lymphotropic virus (HTU-I). This sequence is from the long terminal repeat of HTLV-I and represents a target for inhibitory nucleic acid of the

   The sequences given in 068397-99 represent fragments of the HIV, HIV-1 and reLV genomes which include the long terminal repeats (LTRs). These sequences which include the long terminal repeats of the invention. The method confers resistance to retroviral infection upon a host cell by inhibiting at least one step in the infection process, esp. retroviral replication, reverse transcription, and translation. A polynucleotide is introduced into the host cell and transcribed. The polynucleotide is complementary to a region of the retroviral genome selected from the 37-region, the primer binding site, the AUG start codon region and the RNA splice sites. This method can be used to prevent and to treat

  747850-747852 are long terminal repeat (LTR) region polynucleotides of human immunodeficiency virus (HIV), feline immunodeficiency virus (FIV) and human T-cell lymphotropic virus type I (HTLV-I), respectively. Antisense oligonucleotides against these polynucleotides are used in a method for conferring resistance to retroviral infection on a host cell. The antisense sequences are transfected into the host cell to prevent viral replication by binding to a site important for this process, e.g. the LTR, PBS (primer binding site), R region (essential for the "first jump" of reverse transcription), start codon or certain sites in the a patient, e.g. by bone marrow transplant to provide protection against

   (Q50835) shows cDNA prepared from RNA extracted from a HTLV-1 infected cell. This was amplified by PCR and was used to construct p21X cDNA (Q50836). Primers and probes were then manufactured (Q50837-43), these are useful for the detection of HTLV-1 infection.

   This fragment contains a sequence close to the 5'-UTR of HTLV-1 and the mouse alpha-globin distal intron. The fragment is used in the construction of plasmid pSEI which was designed as a cloning vector in Ecoli and an expression vector in animal cell:
                                    New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

   mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

  В
   В
   Q
  plasmid pWRG3169 is a tandem plasmid encoding both subunits, i.e. (p35 (see W44004) and p40 (see W44005), of murine interleukin-12 (II-12). Each subunit gene was cloned from a mouse spleen cDNA (ibrary and has been placed under the transcriptional control of a separate cytomegalovirus (CMV) promoter. An SV40 splicing donor/splicing acceptor is provided between each subunit gene and its CMV promoter. The backbone of the plasmid is from pUC19. (pWRG3139 induces at least twice the expression of II-12 as the bicistronic vector pWRG3196 (see V02043) in vivo and in vitro. A novel method of treating tumours in a mammal involves delivering copies of an expressible foreing genetic construct, especially pWRG3169 or pWRG3196, comprising a promoter operative in the mammalian epidermal cells and DNA sequences encoding p35 and p40 subunits of II-12 to target cells in vivo. Delivery of the construct allows II-12 expression for treatment of solid, metastatic or disseminated tumours, and regression of established tumours. The treatment is effective even when the genetic

  protein (GFP) coding sequence.

The invention relates to a non-human transgenic animal having a reporter gene coupled to a skin metabolism promoter. The transgenic animal can be used in a method for evaluating a treatment for its effect on skin. The method, together with the transgenic animal are useful for evaluating a compound for its effect on the health or appearance of the skin. The method enables rapid and efficient evaluation of compounds for their effect on skin.
   This sequence represents a construct containing the matrix metalloproteinase 9 (MMP9) promoter linked to the green fluorescent
  Transgenic animal having a reporter gene coupled to a skin metabolism-related promoter

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  Similarity
   NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Sequencing vector: plasmid; 15%
Chemistry: Dye-primer ET; 85% of reads
Chemistry: Dye-terminator Big Dye; 15% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 204654 bases at least Q40
Consensus quality: 207772 bases at least Q30
Consensus quality: 209589 bases at least Q20
  Direct Submission
Submitted (08-DEC-1999) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St.
  Homo sapiens chromosome 11 clo SEQUENCE, 14 unordered pieces.
   Center: Washington University Genome Center code: WUGSC
  University School of Medicine, 4444 Forest Park Parkway, MO 63108, USA
On Sep 2, 2000 this sequence version replaced gi:9838138
   ı (pases 1 to 215541)
Waterston, R.H.
  Center project name: H_NH0307P09
  2 (bases 1 to 215541)
Waterston, R.H.
  Unpublished
  The sequence of Homo sapiens clone
  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
  HTG; HTGS_PHASE1; HTGS_DRAFT.
   AC016904.4 GI:9964994
  Quality coverage: 5.04 in Q20 bases; agarose-fp Quality coverage: 5.27 in Q20 bases; sum-of-contigs
   Web site:http://genome.wustl.edu/gsc/index.shtml
   Homo sapiens
  Insert size: 158000; agarose-fp
Insert size: 214241; sum-of-contigs
   arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
  NOTE: This is a 'working draft' sequence. It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is
  as soon as it is available and the accession number will be preserved.

   This is the DNA sequence of vector ptrAp3. This mammalian expression vector contains a cDNA encoding human placental alkaline phosphatase (AP, see w55047) lacking a signal sequence. When the ptrAp3 is transfected into a mammalian cell line, such as COS7 cells, Ap protein is neither expressed nor secreted since the AP cDNA of ptrAp3 does not encode a signal peptide or a membrane clanchor sequence. However, insertion of a cDNA encoding a signal peptide sequence into ptrAp3 facilitates the expression and secretion of AP upon transfection of the DNA into mammalian cells. The presence of AP activity in the supernatants of transfected cells therefore indicates the presence of a signal sequence in the cDNA of interest. This forms the basis of a novel method for the cDNA of interest. This forms the basis of a novel method for the sequence, i.e. secreted or membrane-associated proteins of potential therapeutic value. An isolated clone (see V2707), designated ethb018f2, was isolated clone (see W55045) protein having multiple, consecutive IgG domains. The method is very sensitive and is suitable for high throughput screening techniques and

  This sequence represents a DNA molecule with gene expression regulation activity. This sequence is used in a plasmid for regulation of gene expression, and treatment of viral infection pref. human T-cell leukaemia and HIV. The plasmid also encodes a protein which is used as an antivirus agent, and also in a method for detecting cancer. The DNA molecule and protein have potential uses in gene therapy, and the plasmid may also have potential use in the treatment of TSP.

  methods for the expression and co-amplification of genes encoding recombinant proteins in cultured cells. The methods permit the isolation of cell lines which have co-amplified input recombinant sequences which encode an amplifiable marker, one or more expression vectors encoding a protein of interest and optionally a selectable marker. The amplified cells provide large quantities of recombinant proteins suitable for immunotherapy for treatment or lymphomas and leukaemias. The methods permit the production of custom vaccines, including multivalent vaccines that reflect the degree of somatic variation found in a patient's tumour.
   SR alpha enhancer/promoter in plasmid pcDL-SR alpha 296. The SR alpha enhancer/promoter is composed of human T cell leukaemia virus 15' untranslated sequences and the SV40 enhancer. It is reported to increase expression from the SV40 enhancer/promoter by 10-fold in host cells, and is active in a broad range of cell types. The SR alpha enhancer/promoter has been utilised in

                    with a vector comprising a polynucleotide coding for RNA which is complementary or homologous to a nucleic acid sequence within at least one gene from the retroviral genome and which inhibits replication of the retrovirus. Particularly preferred target genes are those coding for the ENV, PDL, GAG proteins. Antisense sequences may also target the ART and TAT splice sites, the region around the translation initiation codon (AUG) or the primer binding site (PBS) of the retrovirus. The method is especially intended to confer resistance to infection by human immunodeficiency virus (HTV), feline leukaemia virus (FELV) or human T lymphotropic virus 1 (HTLV-1). This sequence is from the long terminal repeat of HTLV-I and represents a target for inhibitory nucleic acid of the

   of the invention. The method confers resistance to retroviral infection upon a host cell by inhibiting at least one step in the infection process, esp. retroviral replication, reverse transcription, and translation. A polynucleotide is introduced into the host cell and transcribed. The polynucleotide is complementary to a region of the retroviral genome selected from the 3'R region, the primer binding site, the AUG start codon region and the RNA splice sites. This method can be used to prevent and to treat

  T47850-T47852 are long terminal repeat (LTR) region polynucleotides of human immunodeficiency virus (HIV), feline immunodeficiency virus (FIV) and human T-cell lymphotropic virus type I (HTLV-I), respectively. Antisense oligonucleotides against these polynucleotides are used in a method for conferring resistance to retroviral infection on a host cell. The antisense sequences are transfected into the host cell to prevent viral replication by binding to a site important for this process, e.g. the LTR, PBS (primer binding site), R region (essential for the "first jump" of reverse transcription), start codon or certain sites in the 3 and 5 untranslated regions. Resistant cells can be introduced into a patient, e.g. by bone marrow transplant to provide protection against retroviral infection.
   New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

   mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
The present sequence is that of eukaryotic expression vector plasmid pCMV-MC1. The plasmid is derived from pCMVbeta by

identify transformed cells, to measure gene expression in vitro and in vivo, to label specific cells in multicellular organisms (e.g. to study cell lineage's), to label and locate fusion proteins, and to study cell lineage's), to label and locate fusion proteins, and to study intracellular trafficking. Commonly used reporter genes include beta-galactosidase, firefly luciferase, alkaline phosphatase; chloramphenicol acetyltransferase (CAT), and beta glucuronidase (GUS). However, these have limitations in their use. Frequently, these reporter genes require the addition of a substrate and the size of certain proteins means that the expression of reporter CC fusion proteins can be difficult. The light stimulated GFP CC cofactors substrates or additional gene products from Aequorea CC victoria an as the GFP genes have been humanised, they are expressed at sufficient levels to be detectable in human cells,

   Humanised green fluorescent protein (gfp) genes can be used to ci dentify transformed cells, to measure gene expression in vitro and cin vivo, to label specific cells in multicellular organisms (e.g. to ct study cell lineage's), to label and locate fusion proteins, and to study intracellular trafficking. Commonly used reporter genes include the characteristic control acetyltransferase (AT), and beta glucuronidase (CUS). However, these have limitations in their use. Frequently, these reporter genes require the addition of a substrate and the size of certain proteins means that the expression of reporter fusion proteins can be difficult. The light stimulated GFP fluorescence is species independent and does not require any coffactors substrates or additional gene products from Aequorea coffactors and as the GFP genes have been humanised, they are coffactors and sthe GFP proteins.
